

Did you know?

- Semi retractable claws make the red panda great climbers.
- These animals have an enlarged and elongated wrist bone which acts like an extra thumb; this allows them to grip on to their food.
- Red pandas mainly communicate with each other through scent. They leave droppings in particular places and have glands on their feet to leave smelly marks that give information to their neighbours.
- The red panda tend to be found on the north facing side of their habitat where it is a bit cooler.

I have found some facts from the Marwell Zoo web site that I didn't know!!!

Hope you enjoyed remembering all of our animal work from Habitat Explorer project in the Autumn Term.
